Title : Equine Leptospirosis in Hungary.

Orig Pub : Magyar allatorv. lapja, 1957, 12, No 1-2, 2-9.

Abstract : In Hungary, horses become infected with leptospirosis through diseased swine and cattle, and therefore its principal causative agent in horses is *Leptospira pomona*. In single cases *L. sejroe-hebdomadis*, *L. byos*, and even *L. grippo-typhosa* could be detected. 5 to 60% of the horses of the country are carriers of the symptomless infection. In some cases the disease is manifested clinically by a 2-6 day rise of temperature, sluggishness, refusal to eat, catarrh of the conjunctiva, presence of blood and albumen in the urine, and jaundice.

Title : Treatment of Horse Leptospirosis in Hungary.

Orig Pub: Magvar allatorv. lapja, 1957, 12, No 1-2, 7-15.

Abstract: For experimental purposes, three horses were inoculated with *Leptospira pomona*. When fever and other symptoms appeared, 600 units of penicillin were administered intravenously, as well as one million units of bismocillin (I) intramuscularly at the same time (to one of the horses on the second day of fever, and to the other two horses on the third to fourth days). All symptoms of the illness disappeared

"Data Concerning the Problem of Residuum Formed at the Place of Pulmonary Abscess After Treatment with an Inhibitor Compound."

Budapest, Orvosi Hetilap, Vol 107, No 40, 2 Oct 66, pages 1883-1892.

Abstract: [Authors' Hungarian summary] The fate of residua formed at the site of pulmonary abscess was studied in 90 patients treated for the disease by inhibitor compounds between 1953-59. Residuum was diagnosed in a total of 64 cases. The patients were under medical control for 6-12 years after their discharge and 56 patients participated in the present study. In these, cicatrized residuum and residual cavity were distinguished from a radio-morphological aspect. Among the patients discharged with a residual cavity, resection was performed in 5 because of hemorrhage and in 3 because of recurrence. The other patients were free of symptoms several years later. 3 Hungarian, 28 Western references.

110. On the preparation of a  $\text{SiO}_2$  material suitable for the production of glass permeable to ultraviolet rays. H. I. d e w o i, O. K a s z a. *Epitanyagipari K6zponti Kutat6 Int6zet* (Central Research Institute for the Building Materials Industry), Report No. 84, 1958, 16 p., 3 figs., 2 tabs.

It was found that sand of thousandth per cent order of size containing  $\text{Fe}_2\text{O}_3$ ,  $\text{TiO}_2$ , and  $\text{CrO}$  cannot be prepared by flotation since the mineral particles separating during flotation are only 0.1–0.2% of the total quantity of material. The problem cannot be solved either by acid treatment (boiling, autoclaving) or by the reduction of particle sizes because the above contaminating oxides do not enrich certain places but are evenly distributed in the sand grains. Further experiments were conducted by means of digestion. Basic material containing  $\text{SiO}_2$  of sufficient purity for the manufacture of glass types permeable to ultraviolet rays can be produced by the following method: after precipitating the silicic acid by means of sulphuric acid from water glass digested with sodium sulphate, the precipitate is dehydrated and the silica dried, filtered and ignited until free of sulphate.

"The Frequency of W.P.W. Syndrome and its Evaluation in Children and Young Adults."

Budapest, Orvosi Hetilap, Vol 104, No 31, 4 Aug 1963, pages 1441-1448

Abstract: [Authors' Hungarian summary] After a report on the survey of medical literature, the authors describe 24 cases of W.P.W. syndrome which have been followed by them for several years. The frequency of the syndrome is 1.15 per cent among the patient material available to the authors. Two-thirds of the patients are boys, the youngest 3 1/2 years old. Eleven of the patients were without symptoms. Eight patients had organic heart defects (congenital or carditis). In one of the cases the disease developed and later became chronic after scarlet-fever carditis, in another case, a child with combined heart defects, the syndrome manifested itself periodically, a few days before death. Autopsy was performed on this patient. Paroxysmal tachycardia occurred in 4 cases. The effect of stress, atropine, hyperventilation, carotid-sinus compression, the Valsalva test, and the ocular reflex on the EKG graph of patients with W.P.W. syndrome has been investigated. Neurological and EEG tests were made to study the role of the nervous system
